

UPDATED EXCELLENCE IN COMPREHENSIVE MANAGEMENT OF PATIENTS WITH ACUTE CORONARY SYNDROMES

Higinio Martin. Hospital Galdakao

The development of numerous clinical studies whose results are evaluated according to the methodology of the evidence-based medicine has let us know what interventions improve the results of the patient with SCA, and are summarized in International Guidelines. Unfortunately, a gap is observed in the implementation of such interventions in clinical practice. There is a remarkable variability in the magnitude of this gap from site to site, with consequences for the patients.

If you are looking for the excellence you should follow the following steps:

- Try to get the best possible management through local Protocols aimed to achieving the greater implementation of Clinical Practice Guidelines in your environment.
- Check what you do and your results. It is therefore essential to carry out a Prospective Registry.
- Narrow the gap between your clinical practice and implementation of evidence-based guidelines.
- Repeat all the points as often as necessary so that the difference between the best possible treatment and your practice is minimum.
